

ganitel Brand insight and technicalities

Project Overview

ganitel's core mission is to partner with local service providers in the **hospitality**, **leisure**, and **tourism** industries to create curated travel experiences. We leverage technology to repackage these offerings, enabling travelers to conveniently book multiple services as a single package or reserve individual services with ease. This end-to-end journey, from booking to enjoyment, is what we define as “the **ganitel** Experience.”

Target Audience

- **Primary:** Diaspora travelers returning to their home countries for vacations.
- **Secondary:** Middle and upper-class professionals taking leave for rejuvenation.
- **Tertiary:** Any traveler seeking to explore leisure and tourism experiences.

Strategic Vision This project is strategically planned to expand its coverage to all of Africa in the years to come, becoming the definitive platform for African tourism.

This section outlines the initial service categories to be available on the **ganitel** platform, with notes on future scalability.

1. Accommodation Bookings

- **Core Functionality:** Enable travelers to search for, view, and book vacation rentals.
- **Future-Proofing Note:** The system's data model should be designed to handle different property types, initially focusing on guesthouses but with the scalability to easily integrate hotels and other accommodation types in the future.

2. Vehicle Rentals

- **Core Functionality:** Facilitate the booking of vacation car rentals.
- **Future-Proofing Note:** The system must initially support bookings that include a driver. The backend should be architected to allow for the future addition of a self-drive option, which will require a separate module for client verification and security protocols.

3. Restaurant & Dining Services

- **Core Functionality:** Provide tools for travelers to order meals for delivery/pickup and to make reservations for in-restaurant dining.
- **Note:** This represents two distinct but related features that will require separate user flows and data structures.

4. Guided Tours & Activities

- **Core Functionality:** Allow travelers to book tours of historic places, cultural sites, and institutions, with certified tour guides.

5. Flight Bookings

- **Core Functionality:** Enable the booking of flights to various vacation destinations.
- **Note:** This will likely require integration with third-party Global Distribution System (GDS) APIs or similar booking engines.

6. Wellness & Spa Sessions

- **Core Functionality:** Provide a booking engine for spa sessions and other relaxation-focused services.

User Scenarios & Booking Flows

The platform is designed to serve three distinct traveler types, each with a unique booking behavior. The backend architecture must be flexible enough to support all three scenarios seamlessly, prioritizing user convenience in every flow.

1. The Curated-Trip Planner

This user takes a hands-on approach, building a complete, custom itinerary from the ground up. They browse services and destinations, adding each individual accommodation, activity, or transport option to a dynamic trip cart.

- **Technical Implication:** The system requires a robust shopping cart model capable of holding multiple, disparate services. The checkout process must consolidate all services into a single transaction, with clear visibility of all costs and bookings.

2. The Package Customizer

This user prefers the convenience of a pre-designed itinerary. They select a pre-packaged experience, which is curated based on popular data. However, they require the flexibility to modify this package to better suit their needs.

- **Technical Implication:** The platform must present pre-bundled packages as a core feature. The booking engine must support a "configure" or "customize" function, allowing users to add or subtract specific services from the package before completing their booking.

3. The Single-Service Booker

This user books services on an individual, a la carte basis. They may only require a single stay, a one-off restaurant reservation, or a specific tour. They do not need the complexity of a multi-service itinerary.

- **Technical Implication:** The user interface and booking flow must prioritize a fast, straightforward checkout for single-service bookings. This simple transaction model must be a core and easily accessible path for all users.

This section defines the three primary user roles and their specific permissions. This is critical for establishing the backend's security and access control rules.

1. Traveller (Authenticated User)

- **Can:**

- Create and manage their personal profile (e.g., name, contact info).
- View all public listings for Services and Packages.
- Search and filter listings based on criteria (e.g., location, date, price).
- Add items to a booking cart.
- Proceed to checkout and make secure payments.
- View a history of all their past and upcoming Bookings.
- View details of a specific booking.
- Communicate with a Service Provider regarding a confirmed booking.
- Cancel a booking according to the cancellation policy.
- Leave a review and rating for a Service or Service Provider after a booking is complete.

2. Service Provider (Authenticated User)

- **Can:**

- Create and manage their business profile.
- Create, edit, and publish new Service and Package listings.
- Set pricing, availability, and policies for each listing.
- View incoming booking requests and manage their status (e.g., accept, decline).
- Communicate with a Traveller about a confirmed booking.
- Manage payments and view financial reports on their earnings.

3. Administrator (Internal ganitel User)

- **Can:**
 - Manage all Traveller and Service Provider accounts.
 - Approve or deactivate Service Provider profiles and their listings.
 - Manage and resolve booking disputes.
 - Access and analyze platform analytics and reports.
 - Manage and update platform-wide content (e.g., pre-packaged experiences, promotional banners).

Functional Requirements

This section breaks down the platform's features into specific, actionable requirements.

1 User Management

- The system shall allow users to register with an email or WhatsApp and get one-time access codes. service providers will be required to create passwords.
- The system shall provide a secure login/logout process.
- The system shall support "Forgot Password" functionality.
- The system shall allow users to create and edit a profile.

2 Search & Discovery

- The system shall provide a search bar for keywords.
- The system shall provide filtering options by location, date range, price, and category.
- The system shall display search results with a clear visual representation of each listing.
- The system shall allow users to save favorite listings for later reference.

3 Booking & Transactions

- The system shall allow travelers to add multiple Services to a single booking cart.
- The system shall support booking of pre-packaged Packages.
- The system shall allow modification of a Package before checkout.
- The system shall integrate with a secure payment gateway (e.g., Stripe, Flutterwave) to process payments.
- The system shall send automated email confirmations to both the Traveller and the Service Provider upon successful booking.
- The system shall support a clear cancellation and refund process based on defined policies.

4 Provider Management

- The system shall provide a dashboard for Service Providers to manage all their listings.
- The system shall allow providers to upload photos, videos, and detailed descriptions for each listing.
- The system shall provide a calendar view for managing availability and blocking out dates.
- The system shall provide an overview of all upcoming and past bookings.

5 Communication & Community

- The system shall include a private messaging feature for communication between a Traveller and a Service Provider after a booking is confirmed.
- The system shall support a review and rating system for all booked Services and Providers.
- The system shall display average ratings and reviews on each listing page.

Non-Functional Requirements

This section defines the quality attributes of the system that are essential for long-term success.

- **Scalability:** The platform must be architected to handle a 10x increase in users and transactions within the first 3 years. The database must be able to scale without requiring a complete redesign.
- **Performance:** All API endpoints must respond within 500ms under normal load. Page load times should not exceed 3 seconds.
- **Security:** All sensitive data, including user credentials and payment information, must be encrypted at rest and in transit (e.g., using SSL/TLS). The platform must comply with relevant data protection regulations.
- **Reliability:** The system must maintain an uptime of at least 99.9%. A disaster recovery and backup plan must be implemented.
- **Usability:** The user interface should be intuitive and require minimal training for all user roles. The design must be responsive and optimized for mobile devices.

Conceptual Data Model

This section describes how the core data entities are related. This is the blueprint for the database structure.

- **Traveller entity:** Has a one-to-many relationship with the Booking entity. (A traveller can have many bookings).
- **Service Provider entity:** Has a one-to-many relationship with both the Service and Package entities. (A provider can list many services and packages).
- **Service entity:** Can have a one-to-one relationship with a Booking or a many-to-many relationship with a Package. (A service can be booked individually or be part of many different packages).

- **Package entity:** Has a one-to-many relationship with a Booking and a many-to-many relationship with the Service entity. (A package can be booked many times and can contain many services).
- **Booking entity:** Has a one-to-one relationship with a Transaction and a one-to-one relationship with a Review.
